

ECONOMIC GROWTH RESUMES FOR NOW

Figure 1 - UK GDP growth (3 months on previous 3 months, per cent)

Main points

- The UK economy is on course to grow by 0.3 per cent in the third quarter of 2019, a resumption of growth after a 0.2 per cent fall in the second quarter when production had slackened after being boosted in the first quarter by stockbuilding ahead of the original Brexit departure date (figure 1).
- According to new ONS statistics published this morning, the UK economy was flat in the three months to July. The stagnation in output in the three months to July was associated with an above-expectations 0.3 per cent increase in GDP in the month of July, driven primarily by an increase in output in the services sector.
- Recent surveys suggest that output was flat in August, with service sector expansion being offset by contractions in manufacturing and construction. If these trends continue, GDP will grow by around 0.3 per cent in the third quarter (figure 1). This is higher than the 0.2 per cent growth that we had pencilled in last month.

"It looks like there has been a welcome resumption of economic growth in the third quarter, roughly offsetting the fall in the second quarter. But it is not clear how long growth will continue. Only the services sector is expanding, primarily to meet higher demand from consumers driven by increased household incomes fuelled by rising real wages. But there is a limit to how much further real wages can grow without a pick-up in investment and productivity, and this seems unlikely in the near term."

Dr Garry Young**Director of Macroeconomic Modelling and Forecasting**

Economic background

The short-term outlook for the UK economy continues to be dominated by political and economic uncertainty related to Brexit negotiations, against the background of subdued global demand. Under the assumption that a no-deal Brexit is avoided, the [August 2019 NIESR UK forecast](#) is for GDP growth of around 1 per cent in 2019 and 2020. That forecast builds in a period where output is flat around the middle of this year, consistent with the latest data. But the outlook over the rest of the year is very murky, with risks tilted to the downside largely because of the possibility of a no-deal Brexit that would have a significant negative effect on economic growth.

Forecast news

Figure 2 shows how our short-term forecasts for recent quarters have changed as new information has become available; the average absolute error of our estimate of quarterly GDP is around 0.2 per cent. The latest monthly data was stronger than we had expected last month, and we have revised up our estimate for growth in the third quarter of 2019 to 0.3 per cent.

Figure 2 - Evolution of the NIESR quarterly GDP forecast (3 months on previous 3 months, per cent)

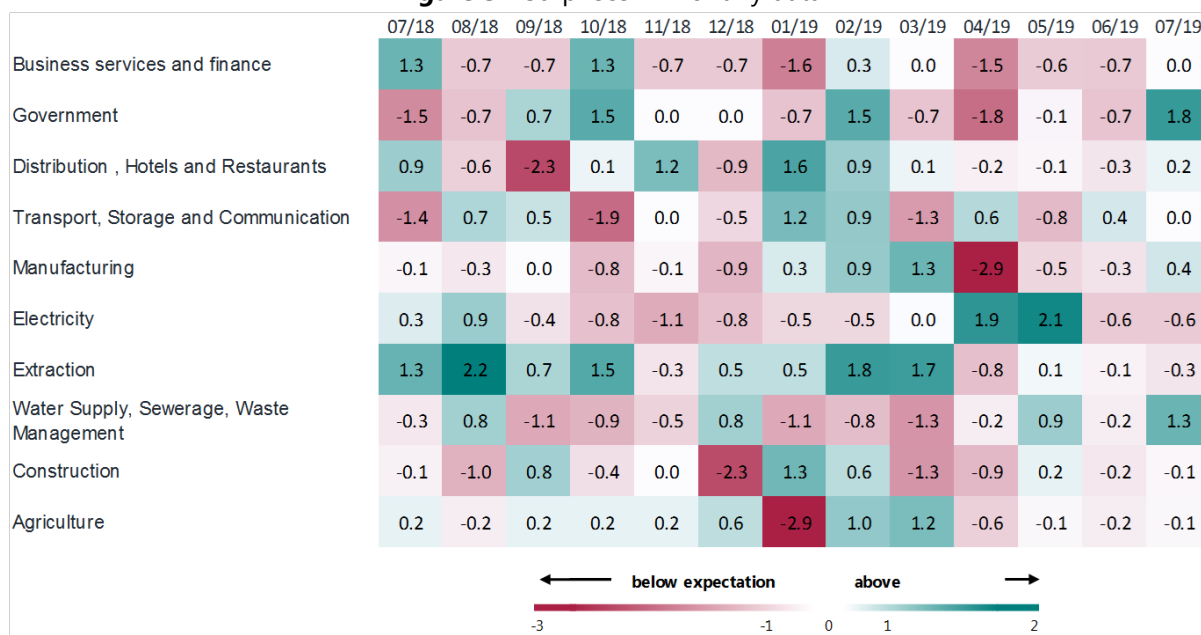

Figure 3 shows a heat map of the data surprises across sectors in the monthly data, highlighting the sectors where the surprises are large relative to the volatility of the output data. This month, the main positive surprises were in the government and water utilities sectors.

Figure 3 - Surprises in monthly data

Note: Cells show forecast errors as a fraction of the standard deviation of errors for each series. Green cells are greater than expected, red cells are less than expected.

Sectoral detail

Economic growth of 0.3 per cent in the third quarter is expected to be driven by the service sector (figure 4). The modest positive contribution of the service sector points to the underlying weakness in the economy, abstracting from volatility in the production and construction sectors.

Figure 4 - Contributions to quarterly GDP growth (percentage points)

Services (80 per cent of GDP)

According to ONS, growth in the service sector was 0.2 per cent in the three months to July, 0.1 percentage points higher than our previous estimate. Within the service sector, official data shows that the information and communication sector, especially the computer programming and motion picture industries, made the largest positive contribution to growth. We forecast the service sector to grow by 0.3 per cent in the third quarter, in line with recent survey evidence of slow expansion (figure 5).

Figure 5 - ONS service sector growth (3 months on previous 3 months, per cent) compared with swathe of business survey balances (standardised)

Note: The shaded swathe shows the highest and lowest values each month of a range of business survey balances that have been standardised so that they have the same mean and standard deviation as the quarterly growth of the ONS series. Source: ONS, CBI, Markit, Bank of England Agents, EC, NIESR calculations.

There was some decline in survey balances in August, as shown by the downward move in the swathe of survey indicators in figure 5. Some of the latest survey balances that are included in the swathe are now more pessimistic than in July 2016 in the immediate aftermath of the EU referendum.

The headline business activity balance in the IHS Markit/CIPS UK services PMI survey dropped to 50.6 in August, down from 51.4 in July, well below the long-run average of 54.9. It was reported that the decline partly reflected a reduction in export demand. This is consistent with a fall in the J.P. Morgan Global Services PMI survey from 52.5 in July to 51.8 in August, one of the lowest readings posted over the past three years.

The quarterly CBI Service Sector survey reported that business volumes were expected to fall sharply over the next three months. Those citing overseas business as a factor limiting business was the highest since February 2013 (+22%).

The EU-collected UK services confidence indicator remained in negative territory for the tenth consecutive month, posting -15.4 in August. This represents the longest negative run in the indicator history since the global financial crisis.

Production (14 per cent of GDP)

Production output fell by 0.5 per cent in the three months to July. The outturn was in line with the forecast of 0.5 per cent contraction that we published last month. We now forecast the production sector to grow by 0.2 per cent in the third quarter, though output in this sector is volatile and difficult to predict on a quarterly basis with any accuracy.

The production sector comprises manufacturing; mining and quarrying; electricity gas, steam and air conditioning; water supply and sewerage; and oil and gas extraction. The largest of these sectors is manufacturing, worth 10 per cent of GDP.

Manufacturing (10 percent of GDP)

Within production, output in the manufacturing sector fell by 1.1 per cent in the three months to July, broadly in line with the 1.3 per cent fall we had forecast last month. Further weakness in recent surveys imply that the *level* of manufacturing output will recede from the level recorded in July, but *growth* in the third quarter could nevertheless be positive at around 0.4 per cent reflecting the recovery from the very weak outturn in April.

Figure 6 - ONS manufacturing sector growth (3 months on previous 3 months, per cent) compared with swathe of business survey balances (standardised)

Note: The shaded swathe shows the highest and lowest values each month of a range of business survey balances that have been standardised so that they have the same mean and standard deviation as the quarterly growth of the ONS series. Source: ONS, CBI, Markit, Bank of England Agents, EC, NIESR calculations.

The IHS Markit/CIPS UK manufacturing PMI balance fell to 47.4 in August from 48.0 in July. Manufacturers reported that production had been scaled back due to a fall in new orders from

both domestic and foreign customers. It was also reported by the CBI in July that order books were perceived to be below normal to the greatest extent since 2010. The below-par level of UK manufacturing activity survey balances was mirrored globally, though the J.P.Morgan Global Manufacturing PMI picked up slightly to 49.5 in August from 49.3 in July.

While much of the weakness of manufacturing output is a global phenomenon, this is overlaid by some UK-specific factors mainly related to Brexit. For example, some respondents to the IHS Markit/CIPS UK manufacturing survey reported that some of their customers were routing supply chains away from UK suppliers in advance of Brexit.

The NIESR [Business Conditions Forum](#) discussed preparedness for Brexit at its meeting on 14 August, including the likelihood of increased stockbuilding ahead of the 31 October. It was reported that there was no evidence of additional stockbuilding yet, and that this could be because companies were waiting for more clarity ahead of the 31 October deadline or simply because it was too early to stockpile. There were also reports of a shortage in warehouse space for the period around end-October because of seasonal Christmas demand.

Mining and quarrying (2 percent of GDP)

Mining and quarrying is a small but erratic component of industrial production that can have an influence on overall GDP growth. Output fell by 1.2 per cent in the three months to July, broadly in line with the 1.1 per cent decrease we had forecast last month.

Construction (6 percent of GDP)

Output in the construction sector fell by 0.8 per cent in the three months to July. This was in line with what we had forecast last month.

The latest reading from the IHS Markit/CIPS construction PMI survey signalled further falls in construction activity, with the headline business activity balance at 45.0 in August, down from 45.3 in July.

Table 1 - Summary Table of GDP growth (2016=100)

			Index of Services - Components					Index of Production - Components

Health warning

The NIESR GDP Tracker provides a rolling monthly forecast for GDP growth. Our first estimate of growth for any particular quarter starts in the first month of that quarter and is then updated each month until the first official release in the second month of the following quarter. So, for example, our first estimate of growth in the third quarter of 2019, was published in July and will then be updated three times (in August, September and October) before the ONS publishes its first estimate for the third quarter of 2019 in November. In other words, we publish four estimates of GDP for any particular quarter before the official release and change them as new evidence becomes available.

NIESR's short-term predictions of monthly GDP growth are based on bottom-up analysis of recent trends in the monthly sub-components of GDP. These predictions are constructed by aggregating statistical model forecasts of ten sub-components of GDP. The statistical models that have been developed make use of past trends in the data as well as survey evidence to build short-term predictions of the sub-components of monthly GDP. These provide a statistically-based guide to current trends based on the latest available data. Each month these predictions are updated as new ONS data and new surveys become available.

It is important to stress that the timelier NIESR guide to quarterly GDP growth is less reliable than the subsequent ONS data releases as its data content is lower, particularly for estimates of the current quarter which in some months will be based only on forecasts rather than hard data. To mitigate this issue, NIESR provides a guide to average errors based on past performance. NIESR also provides clear guidance on how the latest news has caused its estimates of GDP growth in the current and preceding quarter to change and thereby quantify how the short-term outlook is being affected by recent data releases.

As the bottom-up methodology for producing estimates of GDP growth for the current and preceding quarters is still new, we do not yet have a long track record of estimates produced by this approach. To check how our methodology would work in real time we went back to late 2016 to produce judgement-free forecasts of GDP growth in future months based on the monthly data series available for the components in November 2016 (this is the earliest vintage currently available on the ONS website) and in each subsequent three months. These are shown in the table below, which has been updated to include estimates since we started producing the GDP Tracker in July 2018. We calculate the forecast quarter-on-quarter growth rates for the current quarter and compare these to the ONS first estimates of quarterly growth. The average absolute error for the quarters considered was 0.2 % points. The largest error was for 2019Q2 when our GDP tracker in May pointed to growth of 0.3 per cent, 0.5% points higher than the ONS first estimate of GDP growth. As shown in figure 2, we correctly revised our estimate of 2019Q2 growth down to -0.2 per cent in June when monthly GDP figures for April indicated a fall in output.

Forecast Error Analysis: Quarterly GDP growth (%)

Quarter	ONS first estimate	ONS latest estimate	NIESR nowcast*	Error in NIESR nowcast**	ONS latest – first
